

# Blame It on My Youth: Employer Learning and Age Discrimination

---

Jan Sauermann (IFAU)

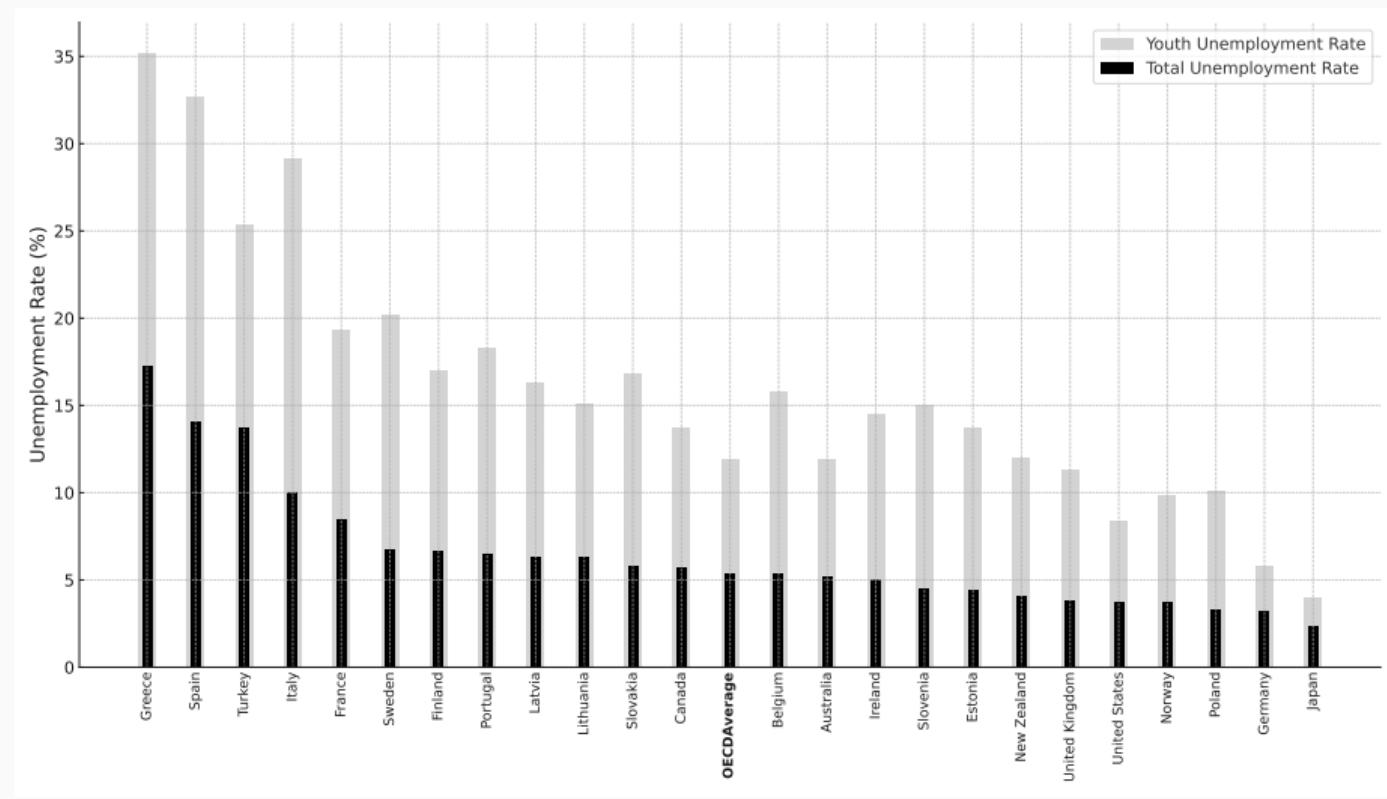

*with Sebastian Butschek (University of Innsbruck) and Louis-Pierre Lepage (Stockholm University)*

IFAU Seminariekonferens, December 2025

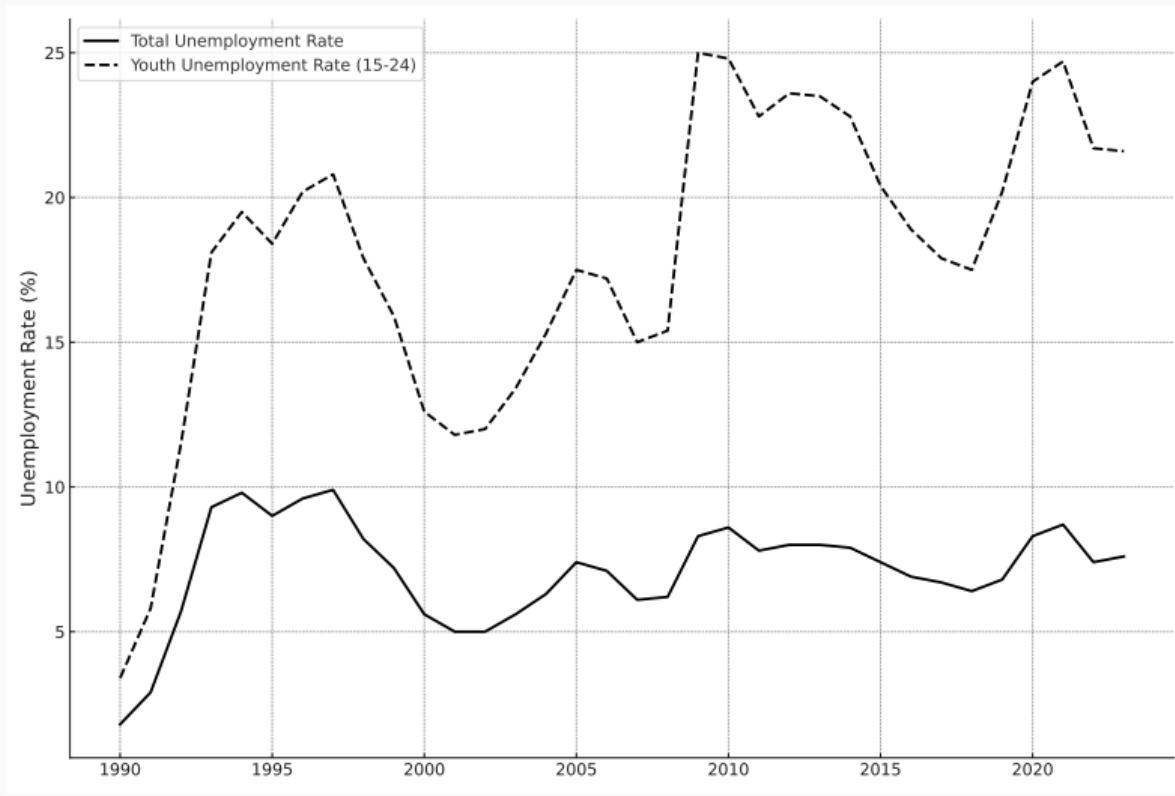

## Motivation

---

# Motivation: (Youth) unemployment 2019

# Motivation: (Youth) unemployment in Sweden over time

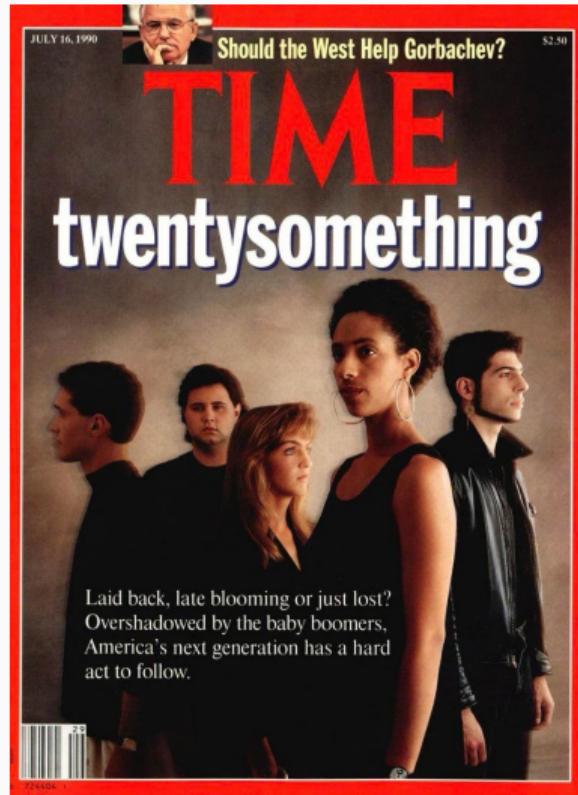

# Motivation: consequences for young workers

---

- Young workers face:
  - Lower wages than prime-age workers
  - Higher unemployment and job instability
  - Stronger exposure to business-cycle shocks
- Early-career shocks have persistent effects on:
  - Careers
  - Earnings
  - Social outcomes (family, children)
- Less known: what are the beliefs about young workers (and their quality)?
- How do individuals (and employers/managers in particular) perceive young workers?

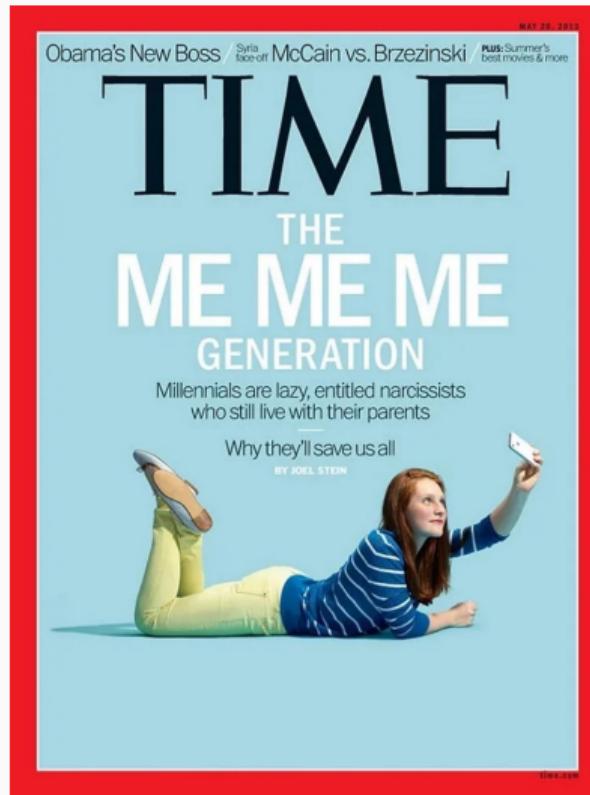

## Illustration: Perceptions about young generations

Year: 1990

## Illustration: Perceptions about young generations

Year: 2013

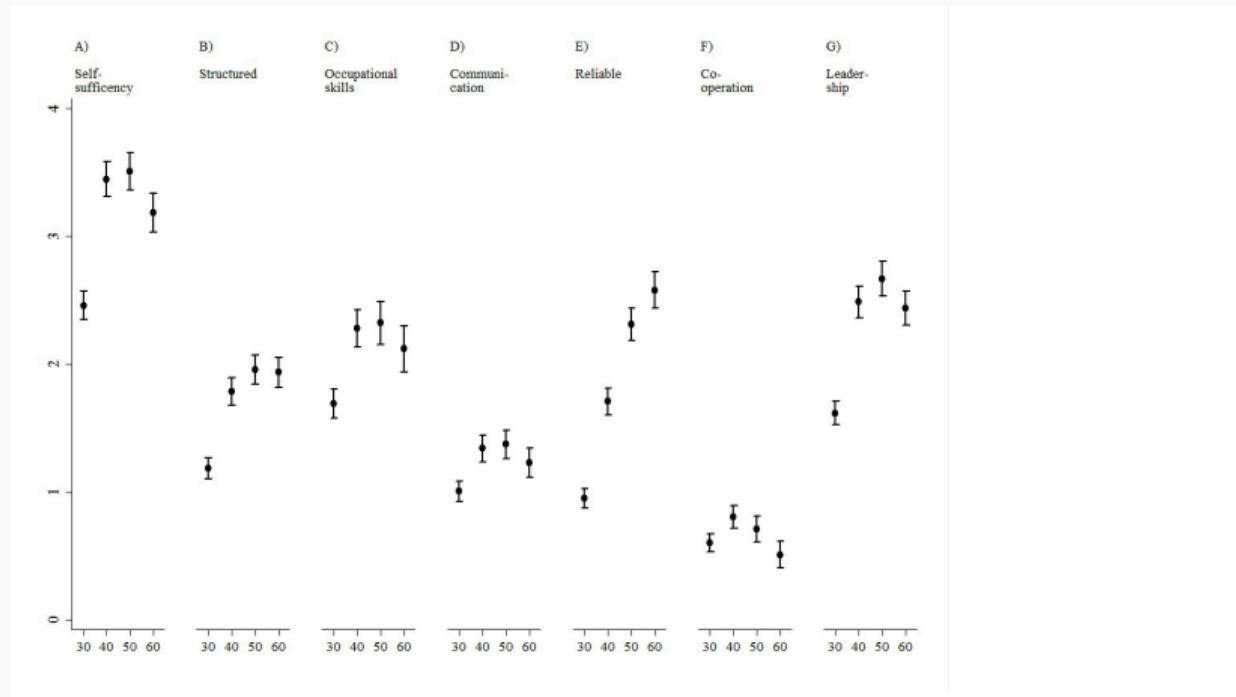

# Illustration: Perceptions about young generations

Year: 2023

# Employer survey (Carlsson & Andersson; 2019)

"Suppose that you are recruiting a new employee to a typical position in your workplace. To what extent do you think that an average employee at age 30, 40, 50, and 60 would have the following characteristics?" N = 1,336.

## Aim of this paper

- Employers treat young workers (candidates) differently than prime-age workers
  - Employers treat young workers as a group
  - Employers treat prime-age workers as individuals
- Key idea: employers are
  - (1) uncertain about the productivity of a worker characteristic (e.g. age) and
  - (2) imperfectly observe productivity at hiring  
⇒ Discrepancy between expected and realized productivity ⇒ shock
- Research question: do employers value experiences with new hires differently for young vs prime-age workers?
- Explore different mechanisms (in progress)

## Related literature and contribution

---

- Employer learning:
  - Workers' productivity revealed gradually (Farber & Gibbons; Altonji & Pierret)
  - Employers rely on observables early on → statistical discrimination
- Age discrimination:
  - Mostly about **older workers** (e.g., Neumark et al., 2016)
  - Callback evidence for youth: Farber et al., Carlsson et al.
  - Policy shocks affecting youth: Saez-Marti et al.
- Organizational learning:
  - Learning from hires (Lepage; Li; Benson et al.)

# Contribution

---

- New stylized fact: Dynamic spillovers exist for young hires, but not for prime-age hires
- New empirical evidence:
  - Linked Swedish registers + enlistment test scores
  - High-quality productivity proxies unobserved by employers
- Future evidence:
  - Large-scale employer survey on age beliefs and uncertainty

# Remainder of the presentation

---

Data and empirical strategy

Main Results

Robustness

Conclusion

## **Data and empirical strategy**

---

# Data sources

- Aim: construct panel data of all **hiring events of all establishments**
  - Hiring event: one or several hired individuals in month  $m$
  - Based on ANST/JOBB employment spells
  - Allows to create establishment-specific **biography of hiring events**  
(Complemented with education, age, gender, demographics)
- Military enlistment tests:
  - Cognitive tests (4 dimensions)
  - Non-cognitive psychological assessment
  - Standardized stanine scales
- Time period 1990-2009 ► Coverage test scores
- Age of hires: 18-50

## Core idea of our estimation framework

---

- Identify **first hiring event** with each age group of an establishment
- Use **military test scores** to classify these **initial hiring events** with age group  $g$  as positive/negative
- Estimate **how these initial experiences affect future hiring behavior** related to age
- Compare effects across
  - Age groups (for figures)
  - Young (18–35) vs prime-age (36–50) (for tables)

## Estimating equation

How do negative (positive) initial experiences affect future hiring?

$$Y_{jk}^{(g)} = \alpha_g + \beta_g S_j^{(g,\text{first})} + \gamma_g X_{jk} + \delta_{C(j)} + \zeta_{I(j)} + \eta_{Q(t_{jk})} + \varepsilon_{jk}^{(g)} \quad (1)$$

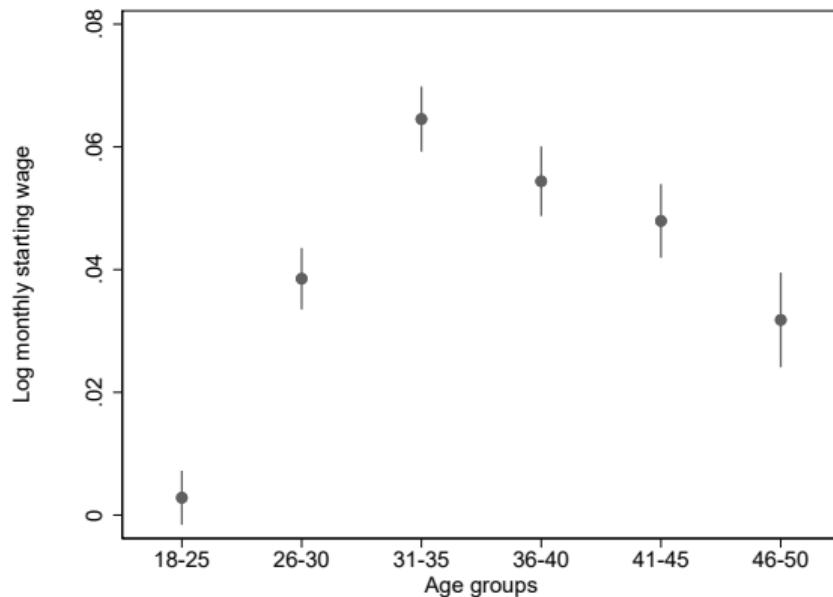

- Outcome
  - $Y_{jk}^{(g)}$  - age group  $g$ 's share in hiring event  $k$  of firm  $j$  (default: up to three)
- Variable of main interest:
  - $S_j^{(g,\text{first})}$ : dummy for positive/negative deviations of residualized skill measure of establishment in firm  $j$ 's **first hiring event** with group  $g$
- Controls
  - $X_{jk}$ : establishment and event-level covariates
  - $\delta_{C(j)}$ ,  $\zeta_{I(j)}$ , and  $\eta_{Q(t_{jk})}$ : county, industry, and calendar year-quarter fixed effects

## Do military test scores matter?

---

- Strong predictors of long-term income (Lindqvist & Vestman, 2011)
  - Employers do **not** observe them at hiring
  - Cognitive/non-cognitive skills are **not priced** in wages of young workers
  - Skills become priced with **experience**
    - Excellent proxy for “unexpected productivity”

# Relationship between test scores and income (information differences)

- Young workers:
  - Flat relationship between skills and wages
- Prime-age workers:
  - Positive skill–wage gradient
    - Employers know far less about young workers at hiring
    - Larger deviations possible

# Conceptualization of deviation from expectations

---

- $S_j^{(g,\text{first})}$ : residualized skill measure of first hire from age group  $g$   
(residualize with: age, industry, field of education, and years of education)
- Classify residualized skill measures as
  - Positive deviations: top 25%
  - Negative deviations: bottom 25%

# Sample definition

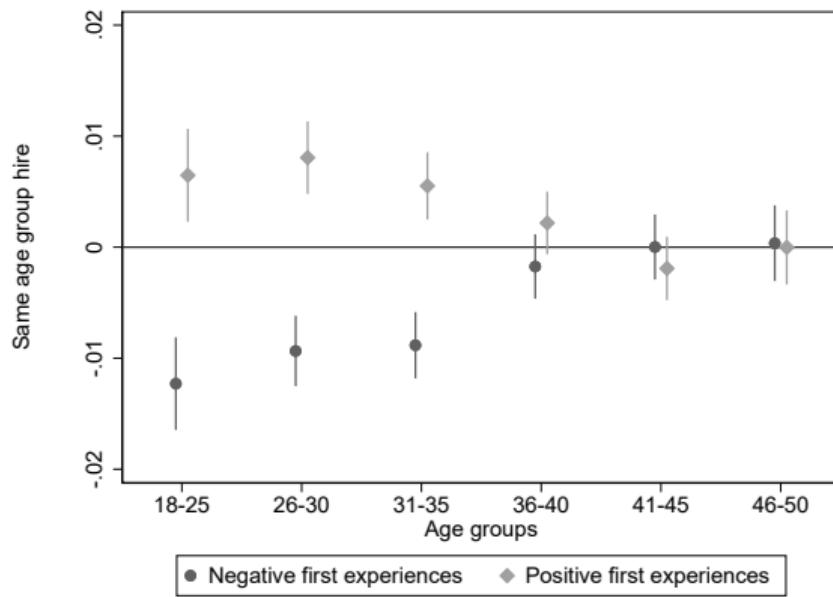

- Estimation framework requires specific sample restrictions
  - Establishments with at least two hires
  - And: initial hires with military test scores
- To capture learning: focus on new establishments of new firms

► Descriptive statistics

## Main Results

---

## Main result: spillovers by age group

- Ages 18–25:
    - Negative shocks → 5 % youth hiring
    - Positive shocks → +3 %
  - Ages 26–35:
    - Same sign, smaller effects
  - Ages 36–50:
    - No spillovers
- Young workers treated as a **group**; older workers as individuals

# Do establishments learn?

1. Organizational learning implies
  - **diminishing effects** over time
  - Stronger effects for new firms than for established firms
2. Experience in hiring young workers
  - In progress
    - Role of managers (“operational leaders”)
    - Survey information to elicit beliefs

# 1. Organizational learning: Decay of spillovers with hiring experience

	1-5	6-10	11-15	16-20	21-25
Age <36=1 × Share neg.	-0.0146 (0.0029)	-0.0128 (0.0029)	-0.0062 (0.0029)	-0.0072 (0.0029)	-0.0043 (0.0028)
Share neg.	0.0030 (0.0017)	0.0019 (0.0017)	-0.0013 (0.0017)	-0.0008 (0.0017)	-0.0002 (0.0017)
Age <36=1 × Share pos.	0.0063 (0.0027)	0.0094 (0.0027)	0.0048 (0.0027)	0.0060 (0.0027)	0.0038 (0.0027)
Share pos.	0.0009 (0.0016)	-0.0002 (0.0016)	0.0016 (0.0016)	-0.0012 (0.0016)	-0.0001 (0.0016)
Outcome mean	0.188	0.186	0.185	0.184	0.183
Units × age groups	399,474	399,471	399,466	399,473	399,478
Units	27,785	27,786	27,786	27,785	27,785
Clusters (firms)	22,558	22,558	22,558	22,558	22,558
Adjusted R <sup>2</sup>	0.139	0.141	0.142	0.145	0.147

- Early youth experiences matter a lot
- Effects persist for years
- But fade as employers:
  - Gain experience
  - Reduce uncertainty
- → Consistent with organizational learning

# 1. Organizational learning: firm age

	New 1st (1)	Old 1st (2)	New non-1st (3)
Age <36=1 × Share neg.	-0.0096 (0.0015)	-0.0026 (0.0032)	-0.0055 (0.0009)
Share neg.	-0.0007 (0.0009)	-0.0012 (0.0021)	-0.0014 (0.0006)
Age <36=1 × Share pos.	0.0064 (0.0014)	0.0048 (0.0032)	0.0038 (0.0008)
Share pos.	0.0003 (0.0009)	0.0025 (0.0020)	0.0016 (0.0006)
Outcome mean	0.189	0.186	0.258
Units × age groups	1,457,388	310,951	5,107,555
Units	235,892	45,511	174,536
Clusters (firm)	196,390	14,224	143,514
Adjusted R <sup>2</sup>	0.105	0.147	0.194

- Compare:

- (1) New estab. of new firms
- (2) Old estab. of new firms
- (3) New firms / non-first

- 2+3 much weaker / insignificant

## 2. Experience in hiring young workers

---

- Less work history
- More noise in signals
- Interview performance less informative
  - Greater **uncertainty** about youth productivity
  - Larger **surprises** → More group updating
- But: in sectors with few/many youth hires similar effect size

## **Robustness**

---

1. Regression specification checks
2. Sensitivity to (variable) choices made
3. Identification and comparability of estimates

## Robustness 1: specifications checks

## Robustness 3: Selection

---

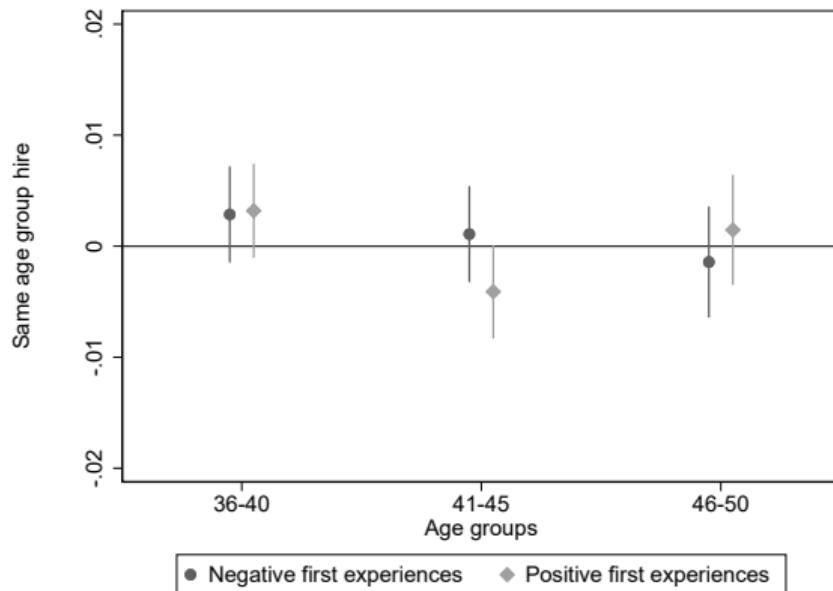

- Are establishments hiring young and old workers just different?
- Skill proximity
- Heterogeneity: differences across sectors, industry and regional characteristics

## Selection 1: Prime-age spillovers within establishments

---

- Are estimated coefficients estimated on different populations and thereby produce this pattern?
- Focus on establishments that make experience with young hires and hire prime-age workers

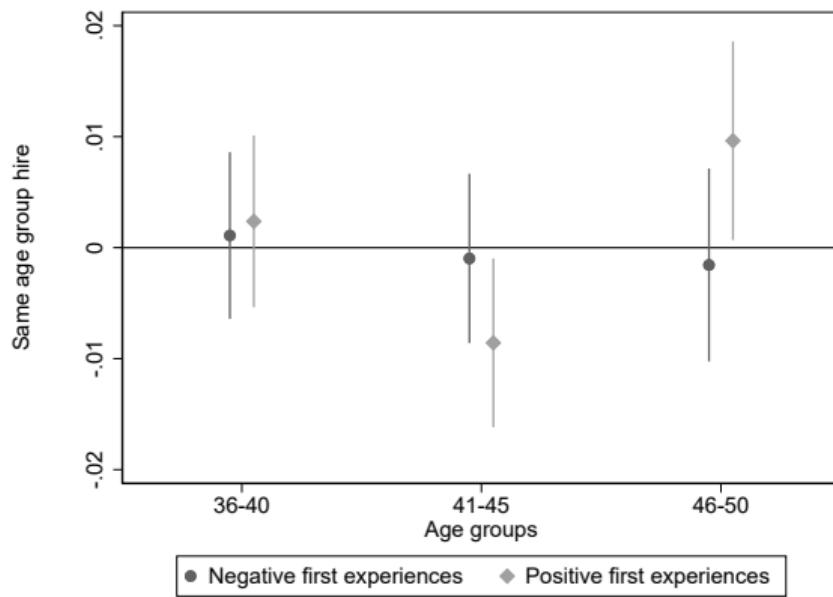

## Selection 1: Prime-age spillovers within establishments

- Same establishments that react strongly to youth experiences
- Prime-age experiences:
  - Near-zero coefficients
  - No systematic updating

→ Not driven by establishment composition

## Selection 1: Prime-age spillovers within establishments (within education field)

- Restrict: first youth and prime-age hires in **same education field**
- Result:
  - Still **no prime-age spillovers**  
→ Not driven by job-task differences

## Selection 2: Skill proximity

	Baseline	Same 1-d EF	Other 1-d EF

## Conclusion

---

# Conclusion

---

- Employers hire youth as a **group**
- Spillovers from early youth hires are:
  - Large
  - Persistent
  - Age-specific
- Mechanism:
  - Employers have **less information** about young workers
  - → Update their beliefs about the group, not individuals
- Implications:
  - Early experiences may entrench **age stereotypes**
  - Policy may need to reduce youth uncertainty (training, certification)

## Next steps

- Employer survey:
  - Beliefs about youth productivity
  - Uncertainty and hiring heuristics
- Extensions:
  - Manager-level variation
  - Spillovers across occupations
  - Effects on wages and job match quality

## Appendix

---

## Backup: sample coverage

First year	Last year	total number of hires	share with test	18-25	26-30	31-35	36-40	41-45	46-50	51-80

# Descriptives

	All establishments	Estimation sample
Average number of employees	13.082 (68.256)	14.465 (62.698)
Number of hires (per year)	5.971 (28.637)	7.608 (32.688)
Value-added per employee (log)	12.111 (2.029)	11.811 (1.634)
Average age	33.872 (5.827)	33.322 (5.227)
Share foreign born	0.117 (0.219)	0.106 (0.184)
Share female	0.421 (0.340)	0.309 (0.274)
Share high-skilled	0.271 (0.297)	0.266 (0.288)
Income	1727.454 (1154.438)	1897.527 (1193.071)
Number of observations	766,431	234,824

## Backup: sample coverage

- Enlistment coverage stable for ages 18–35
- Lower for 36–50 (older cohorts)
- Analysis restricted accordingly

# Prime-age: controlling for timing of experiences

- Whether youth experience comes first or second:
  - No spillovers for prime-age
  - **Age pattern robust to timing**
